Task 4 — Mobile Crop, Stage & Disease Intelligence

⚠ Note on Ground-Truth Points

The provided ground-truth (GT) points are intended as reference data and may contain inaccuracies or errors. Participants should not completely rely on the provided GT points. They are expected to independently verify the points and assess their validity before using them for analysis, model development, and classification.

1. Participants may use **Google Gemini or another permitted multimodal model during the initial data preparation and categorization stage** to analyze the provided crop images and generate **reference/teacher labels** for crop, growth stage, and disease, where applicable.
2. Participants are responsible for **cleaning and validating the provided ground-truth points and associated images** before using them for model development. The generated labels should also be reviewed and refined as required.
3. The categorized and cleaned image dataset should then be used by participants to **train and develop their own crop intelligence model**.
4. The final solution must be a **developed/trained model or deployable inference solution**. It should not simply send every new image to Google Gemini and use Gemini's response as the final output.
5. The developed model should accept a **new crop image as input** and independently generate the required **crop, growth-stage and/or disease prediction**, along with an appropriate confidence or verification mechanism where applicable.
6. Participants are responsible for the complete workflow, including **data cleaning, image preparation, initial categorization/teacher labelling, label validation, model training, validation, and final model deployment/inference**.

📂 Dataset Access

- **Ground Truth Points:** The provided ground-truth points are available in the **Ground_Truth_Points** folder.
- **Images:** The images referenced in the ground-truth points are provided for use in the task.

Expected Outcome: Crop intelligence model
