# Task 6 — Collector's District Intelligence Platform

FarmwiseAI will provide access to **two initial systems/websites** as starting sources for the development of the Collector's District Intelligence Platform.

## 📂 Provided Systems

**1. Initial District Intelligence System**

**Link:** https://dev.d27muebhptw7w1.amplifyapp.com/login

**Credentials:**
Username: admin@ghmc.gov.in
Password: GovtHostels@Admin#2026

The credentials provided by FarmwiseAI are confidential and must not be shared or published.

**2. Leave Management Portal**
**Link : LMS — Leave Monitoring System | Yadadri Bhuvanagiri Collectorate**

**Credentials: No credentials are required.**

The portal provides three different login profiles. On the login page, participants can simply click on the respective profile icon to access the platform.

Participants are expected to explore the available information and determine how it can contribute to their Collector Intelligence Platform.

---

## 🌐 Open/Public Sources

In addition to the above systems, participants are **expected to identify and use relevant publicly available sources**.

The following government/public sources may be used as starting points:

| S no | Source | Potential Use |
|---|---|---|
| 1 | **IMD** | Weather warnings, rainfall, cyclone, heatwave and thunderstorms |
| 2 | **Chennai Flood Monitoring / CFM-DSS** | Flood risk, rainfall, lakes, river/level stations and forecast rainfall |
| 3 | **AGMARKNET** | Agricultural market arrivals and commodity prices |

| S no | Source | Potential Use |
|---|---|---|
| 4 | **Tamil Nadu Town Panchayats Dashboard** | Property tax, water charges, profession tax, trade licences and assessments |
| 5 | **Tamil Nadu Climate Tracker** | Climate indicators, agriculture, energy and environmental information |
| 6 | **AGRISNET Public Dashboard** | Agriculture coverage, scheme monitoring, farmer-officer visits and village mapping |

The above systems are **starting points and not the only sources** to be used.

Participants are expected to identify and integrate **relevant publicly available/open websites and data sources** to make the platform as rich and useful as possible. **There is no fixed limit on the number of permitted open/public sources that may be used.**

Participants are responsible for discovering, collecting, processing, integrating, and analyzing the information obtained from these sources.

The platform should be capable of bringing together information from multiple sources and converting it into **actionable district-level intelligence**.

## 📰 AI-Powered News Intelligence

- Participants are expected to independently identify and collect **publicly available online newspaper content related to the respective district for the previous 30 days**.
- They should use appropriate **AI, OCR, NLP, or other automated techniques** to extract and process relevant information from the collected news content.
- The system should automatically identify **district-relevant news, important incidents, recurring issues, emerging patterns, trends, and developments** that may be useful to the Collector.
- The extracted news should **not simply be displayed as a list of articles**. Participants should use AI/NLP-based analysis to **summarize, categorize, cluster, and identify significant patterns or recurring issues** and present the resulting intelligence in a form that supports administrative decision-making.
- The objective is to move beyond information aggregation and build an **AI-driven intelligence layer** that can identify what is happening in the district, detect emerging patterns, and surface issues that may require the Collector's attention.

## 🖥️ Collector-Facing Platform

The final solution should be a **flexible and reusable platform** where the Collector can decide what information is useful and how the dashboard is organized.

The platform should:

- Integrate the FarmwiseAI-provided systems.
- Integrate additional permitted public/open sources.
- Allow new sources to be added using their **link and, where legitimately permitted, access credentials/details**.
- Automatically process and organize information from added sources.
- Identify important incidents, trends, patterns, alerts, and priorities.
- Provide relevant information through maps, dashboards, visualizations, summaries, or other suitable interfaces.
- Help the Collector understand **what is happening in the district and what requires attention**.

## 🎯 Expected Output

The expected output is **not just a dashboard displaying the two provided websites**.

Participants should develop a **reusable Collector's District Intelligence Platform** where:

**Multiple Sources → Data Collection → AI/OCR/NLP Processing → Intelligence Extraction → Pattern & Trend Detection → Prioritization → Collector Dashboard**

The Collector should be able to **choose the information he/she wants to monitor and customize the dashboard accordingly**.
